

Caring for your lawn mower

Keeping a lawn mower in good working order means more than an annual service. A few everyday steps will ensure top performance through seasons of use.

- Follow the operating and service instructions provided.
- Check the oil level regularly and use recommended fuel and lubricants like SAE 10-30 engine oil.
- Always disconnect the power or spark plug HT lead before working on a mower.
- Do not allow grass residues to build up under the mower or around the cooling ribs and exhaust area. Use a plastic or wooden spatula to clean under the deck, then wash with a brush and water. Never spray water on engine components.
- To clean the underside, tilt the mower – firstly read your operators MANUAL. If tilted the wrong way, oil can enter the air filter or exhaust and damage the engine
- For top performance, check and sharpen blades every 25 working hours.
- Replace a cracked or notched blade immediately.
